

Basic String Operations on Paths

- **dirname** :
 - It will delete any suffix beginning with the last / (slash) character from path and return the result
 - If the path has no slash in it, it will output a dot , means current directory
 - We can use dirname for multiple paths also
- **basename**:
 - Strips directory information or Strips suffixes from file names
- **realpath** : Converts each filename argument to an absolute pathname but it do not validate the path.
